

Car Cards

Create a fluid column based layout of cards similar to the layout shown in the image below.

The Layout

The minimum width for the columns in this layout is **220px** and there are as many columns as will fit in the viewport but no more than 4.

The cards are placed in columns and flow freely from one column to the next based on the total available space. A single card can not break between columns (i.e. all cards start and end within the same column).

The Cards

There are 3 types of cards - small, medium & large with 1, 2 or 3 short paragraphs of text respectively (i.e. the small card is the shortest, with 1 paragraph and the large card is the tallest, with 3).

Other than the number of paragraphs, the cards are identical in structure and consist of

- A title
- A sub title
- An image (from a set of provided images)
The images should grow as the cards become wider, but should try to avoid covering any text as they do so.
- A price
- A button

Try to replicate the layouts of the entire page and of each of the cards as precisely as you can. You can use any combination of the CSS layouting tools which we have worked with.

Recommended Implementation Steps

1. Start by creating the markup without any styling. Create enough cards of each of the three types and different combinations of card sizes and images to produce variety. Make sure the card types don't repeat in a regular pattern and are in random order.
2. Give the cards a border and a background color so you can see their dimensions more clearly. You can change or remove those later.
3. Build the column based layout for the entire page.
4. Implement the card layouts.
